
2) Per-Block Measurement
Start
1) Permutation Generation
(Compute σ using Fisher-Yates, seeded with k and chal. Init i=0.)
Select block $M_{\sigma(i)}$
per-block capture
Baseline SMARM
SMARM-Snap
SMARM-Guard
Disable system-wide interrupts
Measure (hash) block $M_{\sigma(i)}$
Re-enable Interrupts
Disable system-wide interrupts
Copy block $M_{\sigma(i)}$ into Secure buffer
Re-enable Interrupts
Measure (hash) block $M_{\sigma(i)}$
Make block unavailable to Non-Secure (SAU) + DSB/ISB
Measure (hash) block $M_{\sigma(i)}$
Restore Non-Secure availability (SAU) + DSB/ISB
No
3) Loop Check (Is i = n?)
Yes
4) Finalization
(Compute MAC using key k, send response.)
End
Increment index i
